Lithuanian Dependency Treebank (LDT) Alksnis (work in progress)

- 2300 sentences of several text types (newspapers, journals, fiction, legal texts)
- Morphological annotation according to MULTEXT-East format.
- Syntactic annotation: dependency model adapted from the Prague Dependency Treebank analytical layer.
- The syntactic analysis is produced by a rule-based parser.
- Both morphological and syntactic annotations are performed automatically, but revised manually.

Types of MWEs in Lithuanian:
idioms, collocations, named entities, proverbs, MWEs of grammatical nature.

In LDT, we annotate all words of different MWE types separately (Fig. 2), except for those of grammatical nature (Fig. 1).

The solutions for the representation of each type of MWEs are still under development. Possible options:
- to apply more than one principle of annotation in respect to a particular MWE type;
- to have a special label for MWEs.
